

Watch out for water leaks!

Example: water leak caused by improper washing machine installation

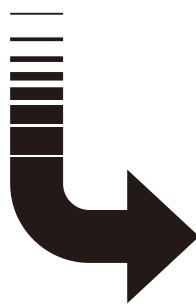

1) Joint section

2) Drainage outlet

Water leaking to the room below

If you are installing your own washing machine that you bought at a second-hand shop or received from a friend or acquaintance...

- 1) The joint section screw not being tightened properly
 - 2) Poor connection between the drainage hose and drainage outlet
- leads to water leaks!

Why?

- 1) The water supply faucet is always open, so if the hose joint is loose then water keeps flowing out!
- 2) While the washing machine is being operated it is periodically drained. If the drainage hose is out of alignment then water will overflow!

Please take care when installing your washing machine!
